## COSC 304 Introduction to Database Systems Enhanced Entity-Relationship (EER) Modeling

#### Dr. Ramon Lawrence **University of British Columbia Okanagan** ramon.lawrence@ubc.ca

#### Enhanced Entity-Relationship Modeling

Enhanced Entity-Relationship (EER) modeling is an extension of ER modeling to include object-oriented concepts such as:

- superclasses and subclasses
- ◆specialization and generalization
- ◆aggregation and composition

These modeling constructs may allow more precise modeling of systems that are object-oriented in nature such as:

- ◆CAD/CAM systems (Computer-Aided Design/Manufacturing)
- ◆GIS (Geographical Information Systems)

### Superclasses and Subclasses Example

Java code:

public class SavingsAccount extends BankAccount

UML class diagram:

Page 4

#### COSC 304 - Dr. Ramon Lawrence

## Review: Superclasses and Subclasses

The object-oriented ideas of inheritance and superclasses and subclasses are taught during programming in an OO language such as Java.

A superclass is a general class that is extended by one or more subclasses.

A **subclass** is a more specific class that extends a superclass by inheriting its methods and attributes and then adding its own methods and attributes.

**Inheritance** is the process of a subclass inheriting all the methods and attributes of a superclass.

Page 3

## COSC 304 - Dr. Ramon Lawrence

## Superclasses and Subclasses Question

Question: How many of the following statements are true?

С

**B**) 1

A) 0

- 1) D is a superclass.
- 2) D has 1 attribute.
- 4) B inherits V from D.

3) B and C are subclasses of A. 5) D inherits attribute X. **C)** 2 **D)** 3

### When to use EER Modeling?

It is important to emphasize that many database projects do not need the object-oriented modeling features of EER modeling.

Remember the goal of conceptual modeling is to produce a model that is simple and easy to understand.

Do not introduce complicated subclass/superclass relationships if they are not needed.

Only use the EER modeling constructs if they offer a significant advantage over regular ER modeling.

#### COSC 304 - Dr. Ramon Lawrence

#### When to use EER Modeling? (2)

EER modeling is especially useful when the domain being modeled is object-oriented in nature and the use of inheritance reduces the complexity of the design.

There are two common cases where EER modeling is useful instead of basic ER modeling:

- ◆1) When using attribute inheritance can reduce the use of nulls in a single entity relation (that contains multiple subclasses).
- •2) Subclasses can be used to explicitly model and name subsets of entity types that participate in their own relationships.

Page 7

#### Emp Relation

eno	ename	bdate	title	salary	supereno	dno
E1	J. Doe	01-05-75	EE	30000	E2	null
E2	M. Smith	06-04-66	SA	50000	E5	D3
E3	A. Lee	07-05-66	ME	40000	E7	D2
E4	J. Miller	09-01-50	PR	20000	E6	D3
E5	B. Casey	12-25-71	SA	50000	E8	D3
E6	L. Chu	11-30-65	EE	30000	E7	D2
E7	R. Davis	09-08-77	ME	40000	E8	D1
E8	J. Jones	10-11-72	SA	50000	null	D1

When to use EER Modeling? Using Attribute Inheritance

Note that the title attribute indicates what job the employee does at the company. Consider if each job title had its own unique information that we would want to record such as:

- ◆EE, PR programming language used (lang), DB used (db)
- ◆SA, ME MBA? (MBA), bonus

COSC 304 - Dr. Ramon Lawrence

Page 8

## COSC 304 - Dr. Ramon Lawrence

## When to use EER Modeling? Using Attribute Inheritance (2)

We could represent all these attributes in a single relation:

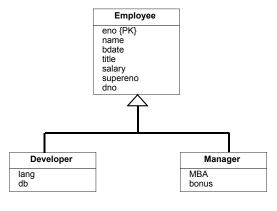

Γ.	<u>eno</u>	ename	bdate	title	salary	supereno	dno	lang	db	MBA	bonus
	E1	J. Doe	01-05-75	EE	30000	E2		C++	MySQL		
	E2	M. Smith	06-04-66	SA	50000	E5	D3			N	2000
	E3	A. Lee	07-05-66	ME	40000	E7	D2			N	3000
	E4	J. Miller	09-01-50	PR	20000	E6	D3	Java	Oracle		
	E5	B. Casey	12-25-71	SA	50000	E8	D3			Y	4000
	E6	L. Chu	11-30-65	EE	30000	E7	D2	C++	DB2		
	E7	R. Davis	09-08-77	ME	40000	E8	D1			N	3000
	E8	J. Jones	10-11-72	SA	50000		D1			Y	6000

Note the wasted space as attributes that do not apply to a particular subclass are  $\mathtt{NULL}$ .

Page 9

# When to use EER Modeling? Using Attribute Inheritance (3)

A better solution would be to make two subclasses of Employee called Developer and Manager:

COSC 304 - Dr. Ramon Lawrence

Page 10

#### COSC 304 - Dr. Ramon Lawrence

# When to use EER Modeling? Using Attribute Inheritance (4)

#### Resulting relations:

#### **Employee Relation**

eno	ename	bdate	title	salary	supereno	dno
E1	J. Doe	01-05-75	EE	30000	E2	null
E2	M. Smith	06-04-66	SA	50000	E5	D3
E3	A. Lee	07-05-66	ME	40000	E7	D2
E4	J. Miller	09-01-50	PR	20000	E6	D3
E5	B. Casey	12-25-71	SA	50000	E8	D3
E6	L. Chu	11-30-65	EE	30000	E7	D2
E7	R. Davis	09-08-77	ME	40000	E8	D1
E8	J. Jones	10-11-72	SA	50000	null	D1

#### **Developer Relation**

<u>eno</u>	lang	db
E1	C++	MySQL
E4	Java	Oracle
E6	C++	DB2

#### Manager Relation

eno	MBA	bonus
E2	N	2000
E3	N	3000
E5	Y	4000
E7	N	3000
E8	Y	6000

Page 11

## Generalization and Specialization

Subclasses and superclasses are created by using either generalization or specialization.

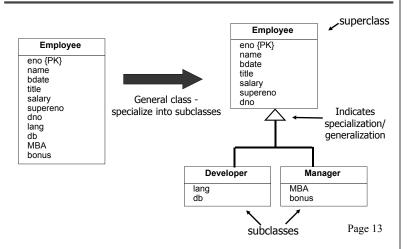

**Specialization** is the process of creating more specialized subclasses of an existing superclass.

- ◆Top-down process: Start with a general class and then subdivide it into more specialized classes.
  - ⇒ The specialized classes may contain their own attributes. Attributes common to all subclasses remain in the superclass.

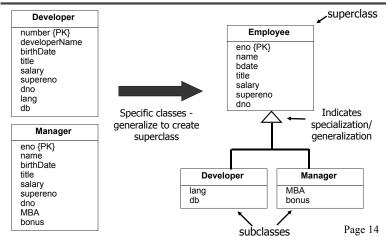

**Generalization** is the process of creating a more general superclass from existing subclasses.

◆Bottom-up process: Start with specialized classes and try to determine a general class that contains the attributes common to all of them.

#### Specialization Example

#### Generalization Example

COSC 304 - Dr. Ramon Lawrence

#### COSC 304 - Dr. Ramon Lawrence

#### Constraints on Generalization and Specialization

There are two types of constraints associated with generalization and specialization:

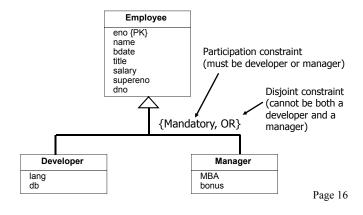

- ◆Participation constraint determines if every member in a superclass must participate as a member of one of its subclasses.
  - ⇒ It may be optional for a superclass member to be a member of one of its subclasses, or it may be mandatory that a superclass member be a member of one of its subclasses.
- ◆Disjoint constraint determines if a member of a superclass can be a member of one or more than one of its subclasses.
  - ⇒ If a superclass object may be a member of only one of its subclasses this is denoted by OR (subclasses are disjoint).
  - ⇒ Otherwise, AND is used to indicate that it may be in more than one of its subclasses.

Page 15

COSC 304 - Dr. Ramon Lawrence

#### Constraints Example

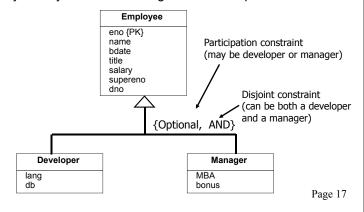

An employee must be either a developer or a manager, but cannot be both.

COSC 304 - Dr. Ramon Lawrence

### Constraints Example (2)

An employee may specialize as a developer or manager. An employee may be both a manager and developer.

#### General Predicate Constraints

**Predicate-defined constraints** specify when an object participates in a subclass using a certain rule.

◆For example, a subclass called RichEmployees can be defined with a membership predicate such as salary >100000.

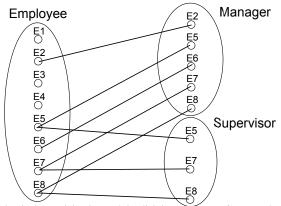

**Attribute-defined subclasses** are a particular type of predicate-defined constraint where the value of an attribute(s) determines if an object is a member of a subclass.

◆For example, the title field could be used as a defining attribute for the Developer and Manager subclasses.

⇒Emp is in Developer if title = 'EE' or 'PR' ⇒Emp is in Manager if title = 'ME' or 'SA'

#### COSC 304 - Dr. Ramon Lawrence

#### Constraints Question

Note: What is the participation and the disjoint constraints for superclass Employee (with subclasses Manager and Supervisor) given these instances? Page 19

#### Relationship Constraints vs. Inheritance Constraints

There is a parallel between relationship constraints on associations/relationships and inheritance constraints on superclasses and subclasses.

- Minimum # of occurrences called participation constraint in both cases
- Maximum # of occurrences called cardinality constraint for relationships and disjoint constraint for subclasses

Possible combinations:

Subclass Constraints	Relationship Constraints
Optional, AND	0*
Optional, OR	01
Mandatory, AND	1*
Mandatory, OR	11

Page 20

COSC 304 - Dr. Ramon Lawrence

COSC 304 - Dr. Ramon Lawrence

#### **EER Question**

**Question:** How many of the following statements are **true**?

- 1) Generalization is a bottom-up process.
- 2) In an UML diagram, the inheritance arrow points towards the superclass.
- **3)** OPTIONAL and MANDATORY are possible choices for the participation constraint.
- **4)** If the disjoint constraint is AND, a given object can be a member of multiple subclasses.
- **5)** If the participation constraint is OPTIONAL, the disjoint constraint must be AND.

**A)** 0

**B)** 1

**C)** 2

**D)** 3

**E)** 4

Page 21

### Multiple Inheritance

If each class only has one superclass, then the class diagram is said to be a **specialization** or **type hierarchy**.

If a class may have more than one superclass, then the class diagram is said to be a **specialization** or **type lattice**.

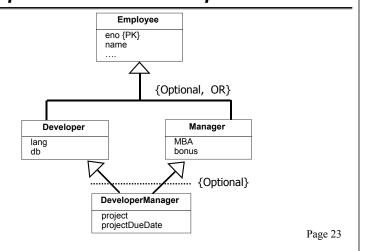

Although multiple inheritance is powerful, it should be avoided if possible.

Page 22

COSC 304 - Dr. Ramon Lawrence

COSC 304 - Dr. Ramon Lawrence

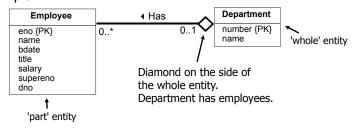

### Multiple Inheritance Example

## Aggregation

**Aggregation** represents a 'HAS-A' or 'IS-PART-OF' relationship between entity types. One entity type is the *whole*, the other is the *part*.

Example:

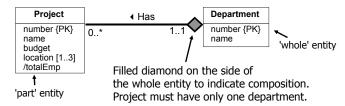

COSC 304 - Dr. Ramon Lawrence

#### Composition

**Composition** is a stronger form of aggregation where the part cannot exist without its containing whole entity type and the part can only be part of one entity type.

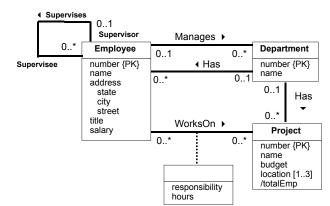

#### Example:

Note: The min-max constraint on the whole side of the relationship (in this case department) must always be 1..1 when modeling composition. Why?

Page 25

#### Original ER Model Example

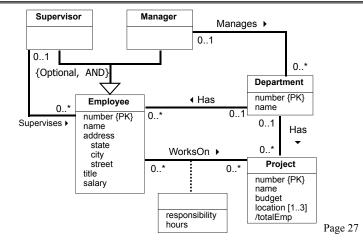

Page 26

COSC 304 - Dr. Ramon Lawrence

COSC 304 - Dr. Ramon Lawrence

#### EER Model Example

COSC 304 - Dr. Ramon Lawrence

### Conclusion

The **Enhanced Entity-Relationship** model (**EER**) model allows for object-oriented design features to be captured.

**Generalization** and **specialization** are two complementary processes for constructing superclasses and subclasses.

Participation and disjoint constraints apply to subclasses.

- ◆Participation of a superclass may be mandatory or optional in a subclass.
- ◆A superclass may only be a member of one subclass (disjoint constraint indicated by OR) or multiple (indicated by AND).

Aggregation and composition are used to model  ${\tt HAS-A}$  or  ${\tt PART-OF}$  relationships.

The features of EER modeling are rarely needed in most database design projects.

Page 28

### **Objectives**

Given an EER diagram, recognize the subclasses, superclasses, and constraints using the notation.

Explain the difference between the participation constraint and the disjoint constraint.

Explain the difference between aggregation and composition.

Given an EER diagram, list the attributes of each class including attributes inherited from superclasses.
